Ventilation Wall Control (99-GBC02) Operating Instructions:

(1) ON/OFF Button
(2) Dehumididstat Button
(3) Fan Button
(4) Fan Speed Indicator
(5) Humidity Setting
(6) ON/OFF light

Turning on the Control:
Press the ON/OFF Button ⏻. The ON/OFF light will illuminate.
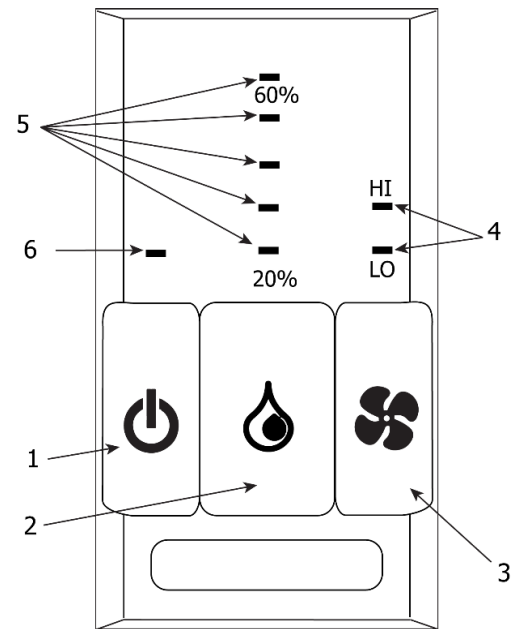

Setting the Ventilation Speed:
Press the Fan Button ✿ to select LOW or HIGH fan speed. The corresponding indicator light will illuminate. If both LO and HI indicator lights are off, the fan is OFF, but will turn ON if required by the Dehumidistat or remote timer (if installed).

Humidity Control:
Your unit will reduce indoor humidity when outdoor humidity levels are lower than indoor humidity levels. This feature is only effective when the outdoor temperature is below 59°F (15°C).

Setting the Dehumidistat:
Pres the Dehumidistat button ◊ until the dehumidistat indicator light is at the desired humidity setting. After a few seconds the dehumidistat indicator light will either flash or be on continuously. A flashing light indicates the humidity level is higher than the humidity setting, and the unit is operating on high speed ventilation. A continuous light indicates the humidity level is lower than the humidity setting. The Dehumidistat will override the current speed setting to HIGH speed. The Dehumidistat function can be turned off by pressing the button ◊ until the dehumidistat indicator light turns off.

⚠ Attention

- Only one main control can be installed on your system.
- Recirculation is not available on all models.
- Timers will not function when mode of operation is set to "OFF", unless specifically installed for the function. (See Installation Guide for other options.)
